

Random windows

Presentation of the module

Digital interfaces get us used to put everything in compartments : windows. But windows are more than simple compartments : they give control to user.

This module randomly distributes a set of panels in the form of pop-up windows. Reader can move, rescale, reduce and restore, or quit them.

How to use

1. All the required files and tools are packed in 'TOOL' folder.

Copy and paste this folder and rename it : you will work only in this folder.

2. Put your images in 'images' folder. Observe carefully the following instructions :

- Folder can contain 100 images at the maximum, numbered from 00 to 99.
 - Then you must name your images as follows : 'image00.jpg',
'image01.jpg', 'image02.jpg'.....'image98.jpg', 'image99.jpg'.
 - Three file formats are allowed : jpeg, png and gif, but all your images must have the same format.
- One last advice :
- To avoid bugs, avoid gaps between images in the folder. For instance if you note a gap between image n°14 and 16, name your next image 'image15.jpg'.

3. Open file 'files/create-page.js' in Notepad or an advanced text editor such as Notepad++. Line 2, enter the number of the last image (without zero before). Line 4, enter extensions of your images (gif, png ou jpg) instead of xxx.

4. Ready ! Open 'index.html' to see and test your creation !
